BNY- AGY talk track - Transcript

00:00:00

Luis Redondo: Enterprise Plus licenses. So, hey, you know, you have anti-gravity as part of those licenses. So, you guys should explore leveraging it as part of that um you know, that agreement.

Brian Schmolt: Excellent.

Luis Redondo: A and so that does two things for us. one is embeds it makes us stickier uh in terms of like our integration into their ecosystem but also as they continue to grow their Gemini enterprise footprint um you know we'll continue to have additional entry points uh so the anti-gravity piece I think is the strategic just to continue to gain mind share with the developers right so that's on a high level that's the the TLDDR

Brian Schmolt: And you can it it hit me this morning uh you can use different models in anti-gravity. So if they are happy with claude you can still use claude inside of anti-gravity.

Ankit Virmani: Mhm.

Brian Schmolt: Uh it just then becomes telling them like what's the why why should you use it over like the cloud

Luis Redondo: Yeah,

David Apolinar: Well,

Ankit Virmani: Yeah.

David Apolinar: well, that that that's right there, right?

00:01:12

David Apolinar: In cloud, you cannot really use it,

Brian Schmolt: harness

Luis Redondo: exactly.

David Apolinar: right? So, at least if anti-gravity lets you swap it through.

Ankit Virmani: Yeah. So,

David Apolinar: Yeah.

Ankit Virmani: openness is one part of the story, right, that Brian and David are talking about.

Luis Redondo: Right.

Ankit Virmani: Second is,

Luis Redondo: Yep.

Ankit Virmani: do we want to talk to them about some example use cases, Luis? Like, uh, this is what we used it for., this is what we used it for.

Luis Redondo: Yeah. Yeah. Yeah.

Ankit Virmani: Like I

Luis Redondo: Give them give them like I think they're going to they're going to be kind of uh they're looking for all kinds of feedback,

Brian Schmolt: Never.

Luis Redondo: right? The the first piece is we did an anti-gravity demo which didn't land as well as it could have um because I'll give you my

Ankit Virmani: Huh?

Luis Redondo: my take on it. It didn't land as well as it could have because we didn't understand that they are much more technical than we thought.

00:02:07

Luis Redondo: Right? So we came in with the anti-gravity demo as more like hey here's a business you you know as an architect trying to build you know on the platform and they were like WTF like we are like two levels three levels down from that right uh and so they are so when you walk into that conversation I think it's more about to your point give them some example use cases technical use cases on how they could use it at scale the openness SP I think they love that like not being locked into any one thing.

Ankit Virmani: Yeah.

Luis Redondo: I think that they actually like that.

Ankit Virmani: Mhm.

Luis Redondo: But then the other the other thing that I think they struggle with a lot is um the landscape is changing so quickly. So, what do they get out of Google that helps them sort of figure out a way for them to have a more stateful environment while still being able to leverage all the all the other models, right? So they're obviously using Gemini, they use the huge anthropic user um that they're you know they're 400% growth on that uh for anthropic this year.

00:03:26

Luis Redondo: So clearly it's resonating well with the developers. Um so that's that kind of gives you guys a background on what's going

Ankit Virmani: Oh,

Luis Redondo: on. And Codex is um a late entrant.

Ankit Virmani: huh.

Luis Redondo: Uh not as much not as much uptake,

Ankit Virmani: Would

Luis Redondo: but I mean he did recently I think uh embedded into the platform. So

Ankit Virmani: something like this tested out on where anti-gravity from a web app data engineering and DevOps perspective works well versus fraud and stuff. We were working with the with a compete team on this. But if we have examples of this, not this sheet but actual examples or an example of modernizing a PCF cloud foundry pivot cloud foundry over cloud run with anti-gravity which had

Luis Redondo: Mhm.

Ankit Virmani: hundreds of files in GitHub that gets like uh refactored something like that. What could be one or two examples that Brian, David and I can work that you think because you have more at least from myself you have more context

Luis Redondo: Yeah.

00:04:37

Ankit Virmani: of what the customer feels and thinks. So help us go into the minds and hearts and give us like two examples that we can work on because

Luis Redondo: Yeah.

Ankit Virmani: all three of us we are very example driven and we can't present slides

Luis Redondo: Yeah. Yeah. Yeah. I know. No. And they they would love that actually. They don't want slides.

Ankit Virmani: without

Luis Redondo: They they really don't care about slides. They want they want the they want it to be a very demo driven conversation and it be more like collaborative Q&A kind of conversation.

Ankit Virmani: Yeah. Mhm.

Luis Redondo: I think I think what makes more sense to them is they are they have they have a lot of legacy applications right and so a lot of the work that they're doing is not necessarily green field work right it's a lot of it is like hey we have this legacy

Ankit Virmani: Morning.

Luis Redondo: solution and then we're adding on additional AI capabilities to it or we improve improving whatever we're doing today by adding this, you know, AI capability to it.

00:05:41

Luis Redondo: Um, so I think it's more about that than it is about building something brand new from scratch.

Ankit Virmani: Yeah.

Luis Redondo: Um,

Ankit Virmani: Oh.

Luis Redondo: and I can tell you their their view in the last call on anti-gravity was how does this help my developers expedite the way that they can actually build, iterate, deploy quicker, you know, do QA on their code, um, and more rapidly, uh, sort of iterate on their development. And I think that's kind of where they are. It's almost like, you know, part of part of the the nuance here is and I think where we have mind share is they know that Windinserve their founders moved to Google last year, right? And they know that a lot of that IP is with us and that anti-gravity looks very similar obviously to Windserve because obviously you know that all that

Ankit Virmani: Um

Luis Redondo: IP is here. Um, but I think they don't quite what we has hasn't resonated enough is what is it that we're bringing to them that is truly different from what cloud code does or codeex, right?

00:07:02

Luis Redondo: And that's the part that's

Ankit Virmani: Yeah. Okay.

Luis Redondo: missing.

Ankit Virmani: So, can we take any sample legacy app and try to move it to cloud run with build iterate and stuff? Do it on codeex versus do it on anti-gravity and find where it was. Is that going to be Is that

Luis Redondo: Yeah, something simple, you know, I mean, something that is not necessarily like they have a whole bunch of um legacy applications.

Ankit Virmani: okay?

Luis Redondo: I have over 5,000 apps obviously large custodial bank, they're going to have a ton of legacy work. So you could just pick pick and choose something simple that is legacy that you could use to showcase the

Ankit Virmani: Yeah. Brian, David, what are you guys thinking?

Luis Redondo: difference.

Ankit Virmani: That was just my myopic vision. Like maybe show them one example, but maybe there's something in your minds that that's like I don't know.

David Apolinar: to really got to differentiate where I mean part of the challenge with this is that when it comes to like we're we're kind of playing catch-up in some extent right because cloud codto was first and at that point the only thing that becomes unique is somewhat integration and specific capabilities with the rest of the platform Right.

00:08:22

David Apolinar: It's more of a hey, you have Gemini Enterprise, but guess what? You also have anti-gravity as part of that licensing. I I if the goal is to kind of convince a lot of developers saying the platform is better, that really at that point becomes more of a model thing, right? They're going to say, "Hey, yeah, Flash 37, you know, 3738 is phenomenal, right?" That and they're not going to be able to get that anywhere else. But you can also use third party models.

Ankit Virmani: Yeah.

David Apolinar: That really is our only story. I don't know that you could honestly say that something's going to stick out significantly better

Ankit Virmani: So,

David Apolinar: today that I'm aware that would convince them that we have a the most unique solution outside of like, hey, you're probably going to miss out on one of the best models that are out there.

Brian Schmolt: Yeah, the the honest amongst friends answer is anti-gravity is not much different than anything else you'll use. There's not a I use it daily. I think it's great.

00:09:19

Brian Schmolt: Um there's not a differentiating feature in anti-gravity that you can't get with quad code or VS, you know, whatever else you're using. Um

Luis Redondo: Yeah. So, let's think through that, right?

Ankit Virmani: Yeah.

Luis Redondo: Like I I think like you got to put yourself in their mindset, right? Part of the problem is think about it from their angle, right? Like if you're sitting in their shoes, right? a part of their their uh feedback is like hey what am I getting that's going to simplify my work right and if it is like optionality meaning like hey I can use I can use the different models within anti-gravity without having to pivot between cloud code and codecs and you know and I can do I can have my developers all kind of use all the three frontier models in the place then that's like ease of convenience that's that's something that helps them. Um I also got this feedback from him right it's like we're running on Google cloud we're running the the developer workstation on GCP we're using your instances we're using you know your accelerators on those workstations so are there things like hey if you're running on anti-gravity on on Google cloud and your runners your owner runners are running on GCP we have some additional linking points to our TPUs or our accelerators that maybe you don't get.

00:10:58

Luis Redondo: And the answer is no.

Ankit Virmani: No, no,

Brian Schmolt: Yes,

Ankit Virmani: no integration between the anti-gravity infra and their workstations.

Luis Redondo: Yeah.

Brian Schmolt: please.

Ankit Virmani: But Brian uh what if we do this the the same like if we if we give them an end to end agent build out in anti-gravity that agent anti-gravity registers it in agent engine and then they use the same license to see that agent in Gemini enterprise app isn't that an integration story and then they get all the lineage and logging and everything and that agent is doing work for them like modernizing now they have identified things they are using GE app as well as a downstream to anti-gravity and they get all the logging monitoring and good stuff in the

Brian Schmolt: Uh,

Ankit Virmani: GAP.

Brian Schmolt: how in tune are these? Yeah, I agree with you. That's a good use case, but how in tune are the developers with G app? It might be a non-factor for them.

Ankit Virmani: Uh yeah, that's true. Will

Luis Redondo: They're using They're using.

00:11:58

Luis Redondo: So it's an interest that's an interesting question. So they have an agentic platform called Eliza, right? And Eliza basically calls Gemini Enterprise app via API, right? And they have a harness that then calls the Gemini Enterprise app uh and you know calls all the first party agents. So like deep research is called through that aentic framework. They're not using our our UI, right? So, but they're using the underlining capability of the of the

Ankit Virmani: Okay.

Luis Redondo: platform.

Ankit Virmani: So they are not um what do we do then? If we have to show integration uh do they use any Google backend services like BigQuery and

Luis Redondo: Yeah,

Ankit Virmani: all?

Luis Redondo: they use BQ, they have GKE, they're using obviously GCE, they have Google Cloud Storage, they are toying with the idea of, you know, expanding the use of enterprise knowledge graph uh through BigQuery graph.

Brian Schmolt: So

Luis Redondo: So because because think about it from their angle,

Ankit Virmani: Yeah.

Luis Redondo: right?

Brian Schmolt: flip

Luis Redondo: They're Eliza is like the front door to everything they're going to do in the future.

00:13:19

Luis Redondo: So what they're trying to do is like basically funnel everything that all the lines of business do,

Ankit Virmani: Heat.

Luis Redondo: all the developers do through Eliza. And so everything is going to be instrumented through there and they're trying to use um EKG or knowledge graph capabilities to to then uh understand like customer defection or like c sentiment across the different work streams they have. So, um, you know, I think it's early on in the path of maturity for them. I would say for for us, they're open to they like Google. Uh, they like what we what we bring to the table. So, I don't think there's anything that is like a a no an off topic. But I do think like this discussion needs to be fairly targeted, right? Because one of the things that they did share with us is like hey don't boil the ocean right like this is a very targeted discussion let's really figure out what what is

Brian Schmolt: So let's uh let's do this then.

Luis Redondo: actionable

Brian Schmolt: It seems like the use case here would be the plug-andplay with Google services.

00:14:33

Brian Schmult: So, let Enkit, myself, and David see if we can find a an angle to press on there because I'm sure the team has some sort of talk track around that. Um, and I think that's that's what we lead with because the the question I was going to ask was how deep are they in the platform?

Ankit Virmani: Yeah,

Brian Schmult: And if they're not using it at all, uh, it's a different story, but it sounds like that's that's kind of the way in.

Luis Redondo: Yeah.

Ankit Virmani: we have the

Luis Redondo: And and I think and I think they I think they're looking for I think they're looking for ways to expand the usage of the platform. Um, and so like to make it easier for their developers to explore using GCP more. I mean, we obviously are in the middle of growing into a new commit that we're going to sign here in the next few weeks. So, I mean, the growth is there. The trajectory is up. Uh, so that's actually a really good thing, a really good signal.

00:15:25

Luis Redondo: Um, and I agree with you, Brian. I think that that's that's the right the right

Brian Schmult: The counterargument you can give them is you're already paying for this.

Luis Redondo: approach.

Brian Schmult: Use it.

Ankit Virmani: Yeah. So, we do have one example. Brian and I,

Luis Redondo: Yeah.

Ankit Virmani: we were on a on a call with another customer I think two weeks ago. We showed them how they would integrate graph rack data with spanner graph bigquery and then today we also have an example of using knowledge catalog for better agent context. So what we can do is if a developer sits and does all this integration it would take them a day or two easily uh

Luis Redondo: Thank

Ankit Virmani: depending on how good of a developer they are. What we can do is we can take a use case like that show them how they would build it so quickly in anti-gravity.

Luis Redondo: you.

Ankit Virmani: you're doing data integration across multiple backends in a single agent deploying it on agent engine and then doing all the maybe I don't know maybe we we'll see once we work through it how how potent is the talk track but maybe to Brian's point that's a good that's a that's a use case like we span across multiple services and integration and ease of integration across multiple GCP services is our top

00:16:39

Luis Redondo: Okay. I mean just remember right that they also have um they

Ankit Virmani: Back

Luis Redondo: have a you have to think about where they are in that journey but I mean it's early they have a lot of

Ankit Virmani: home.

Luis Redondo: onrem legacy stuff as well so it's great to to talk

Brian Schmult: This

Luis Redondo: about the integration on the GCP services I think that's great one of the things that maybe it's good to also call out is like, hey, like this is also a great opportunity for some of those like some of those legacy apps if you're trying to modernize them or you're trying to bring them over, right, to make them nimler, right? This is a good sort of launch point for you to be able to do that.

Ankit Virmani: Yeah.

Luis Redondo: Um, so and I know I don't want to boil the ocean on that because that that is a a very heavy heavily loaded topic but um but it's just giving them giving them more differentiation. I think it's uh is difficult. I I get it right like this is not an easy this is not an easy topic.

00:17:50

Luis Redondo: Um and to make it look seamless is is even more difficult too. So

Ankit Virmani: Yeah, but but I think David and Brian had flagged it early on. Eial.io. modernization or integration. We are not really outshining with anti-gravity versus plot code or or anything else because those things can do it the same way. It's just that we are showing them another way to do so with openness and flexibility and maybe we'll try to sort of sneak in a way to publish these agents in agent engine or something like that to to make sure that they see the proper lineage and stuff.

Luis Redondo: Yeah.

Ankit Virmani: Just want to make sure that that's this group right we are on the same page but we want you to be on the same

Luis Redondo: Yeah. Yeah.

Ankit Virmani: page it's not going to be shiny that

Luis Redondo: Yeah. Yeah.

Ankit Virmani: AGY

Luis Redondo: I think I think it's fine. I mean, he trusts me, right? So, like, so like he knows that I wouldn't bring somebody in that's not going to be good,

00:18:38

Ankit Virmani: Yeah.

Luis Redondo: right? And he knows that you, you know, he knows that we're dialed in. And he actually spent he just so you guys have some more confidence.

Ankit Virmani: Heat.

Luis Redondo: Um, he spent like a whole day with us. he brought his team, his AI development team from Pittsburgh and spent the whole day with us for one of the Gemini um all day events uh with uh here in New York uh a few weeks back um I think in August. So um yeah, he's you know he's he's good, right? He just wants to make sure that we have the right,

Ankit Virmani: Okay.

Luis Redondo: you know, the right um the right level of talk track for the conversation. And uh sooner than later is probably good. Like if we if you guys think that we could do it, you know, I don't know how long you guys need, but um it's more of a collaboration call, not a no standup like serious call. It's a technical call, but uh it doesn't have to we don't have to boil the ocean, right, to prepare for the call.

00:19:52

Luis Redondo: Um so, but I hand it over to you guys to figure out the right

Ankit Virmani: Yeah, I think we'll uh sync up internally.

Luis Redondo: time.

Ankit Virmani: Uh David, me and uh Brian and hopefully uh

David Apolinar: Yeah. Yeah. So this guy the one we're meeting with he's responsible for all AI

Ankit Virmani: yeah

David Apolinar: dev.

Luis Redondo: Yeah. Developer tooling. Yeah.

David Apolinar: Oh,

Luis Redondo: All all all all of dev tools.

David Apolinar: so he's like um and he and just to

Luis Redondo: Yeah. Including AI

David Apolinar: be just to be clear,

Luis Redondo: dev.

David Apolinar: he wants to know what would be a differentiating like why should he look at

Luis Redondo: Well,

David Apolinar: it?

Luis Redondo: I think I think I shared the questions they had over chat.

Ankit Virmani: Yes.

Luis Redondo: Let

David Apolinar: Uh I might have missed that.

Ankit Virmani: Yeah,

David Apolinar: I probably missed it. Sorry.

Ankit Virmani: I I pasted them here again.

David Apolinar: I just Yeah.

Ankit Virmani: I I pasted them here.

00:20:36

Ankit Virmani: Let me paste them

David Apolinar: No,

Luis Redondo: me

David Apolinar: here's the reason why I I'm asking this again.

Ankit Virmani: again.

David Apolinar: I have a really good relationship with the guy at Morgan Stanley who does the exact same thing. And if I can kind of get an idea him like, hey, you know what what may what's making you look at, you know, Gemini and versus XYZ and so forth. Actually, I would have met him today if I couldn't go to the office today. If I can see him on chat. That way when when it comes up I can say look there's another bank we work with they're looking at it for

Luis Redondo: Yeah.

David Apolinar: XYZ direct verbatim from another I guess considering not really competitors different but another bank right and I think that goes way

Luis Redondo: Yeah. Yeah. Yeah. That goes a long way.

David Apolinar: and

Luis Redondo: They they love that actually. David, I think you you bring it up a great point. Um, I mean what they want is they they love when they say,

00:21:19

David Apolinar: Yeah.

Luis Redondo: "Oh, somebody else is doing something similar. Oh, we can learn from what you've done already with them." Oh, they they love that stuff. Um, but I I think to your point, it's like uh they want the integration ecosystem. So like they're asking specifically like, "Hey, how is this helping me with my Vertex APIs? Like how is this helping with your Genai ecosystem?" like what are the things that anti-gravity does that helps us from a you know we're a Gemini enterprise app customer does this help us with that right like those are the levers that I think we have for the call um but yeah like again just um just think through that they're also a launch customer for the Gemini enterprise for financial research agent so they're they were they are one of the uh pilot customers for FRA Okay. Um, so you know they they are continuing to kind of grow into the Google ecosystem.

Ankit Virmani: Any

Luis Redondo: So that's actually, you know, hopefully that kind of warms you guys up as well in terms of the call and the the

00:22:31

David Apolinar: Luis,

Luis Redondo: dialogue.

Ankit Virmani: other

David Apolinar: do these guys uh do they they already have a landing zone yet or are they

Ankit Virmani: questions?

Luis Redondo: Yeah, they have a landing zone. Yeah. Yeah.

David Apolinar: still

Luis Redondo: they they've they are in version two of their landing zone today and they're using GKE, GCE, they're using all the main compute services and um but you know they still have more maturity that needs to be done.

David Apolinar: Well, you can always go back to city.

Luis Redondo: Oh god, don't even don't even

Ankit Virmani: We are we are taking notes.

Luis Redondo: don't get me don't get me started.

Ankit Virmani: What is uh these are the questions right? The data retention authentication and back blocked APIs. backed APIs what AGY APIs are needed for agy and stuff those were the three set of questions twist okay we'll get those answers then I think

Luis Redondo: Yeah. Yeah, that's primarily it.

Ankit Virmani: three of us will work on a use case and probably throw it to you before before them and then we'll

Luis Redondo: Okay. Okay. So, let me know when you guys have some time to kind of uh put your heads together on that and when you think it's a good time for us to sync up with them and I'll just uh I try to look for time to lock us

Ankit Virmani: Yeah,

Luis Redondo: in. Okay.

Ankit Virmani: sure.

Luis Redondo: Thank you guys.

David Apolinar: Cool.

Ankit Virmani: Thank you so much.

Luis Redondo: Great to talk to you. Thank you for everything.

Ankit Virmani: Yeah. Happy elevating.

Luis Redondo: All right.

Ankit Virmani: Yeah.

Luis Redondo: All right. Back to the grind. things.

Ankit Virmani: Yes.

David Apolinar: Yep.
