Security, FS Industries plan for Rohit - Transcript

00:00:43

David Stone: Howdy.

Casey LaRose: Hello, Mr. Stone.

David Stone: Hello, Miss Larose. How are you?

Casey LaRose: Well, you know, today's a little bit of a tougher day. Um, but trying to make sure that I do whatever I can do to get the financial services team what they need. Um, you know, I just think there's probably maybe just like a general feeling of frustration that we're we're we're not going to market with the right message or that we're that our competition is sort of coming at us from every direction, which I think is accurate.

David Stone: Yeah. No, I'm there. I think that that's a fair assessment of um us stitching together the story in a comprehensive and convincing way is not going great. Um, yeah. Yeah, I think that's a fair assessment. Yeah. So, how do we correct it? And I think that's where Rohit was pinging. Um, he threw the flare. Um, one thing that we sent back to Chris um is that we need help from product.

00:01:58

Casey LaRose: Yes.

David Stone: We need help from go to market. And the help we need is them leaning in and not bucking us and supporting kind of getting this together. So for product AR

and team I think would be great to see what's on the road map. What are you developing? I want to know for whiz. I want to know for secops. I want to know for Mandy. I want to know the product roadmap. Give me that so we can align our story going forward. But that's that's the hard part of this conversation I think. Um,

Casey LaRose: Yeah. No, and I mean I mean like I will tell you my whole team was like lit up today because of Gemini Cyber Flash 3.8,

David Stone: yeah,

Casey LaRose: right?

David Stone: we all were

Casey LaRose: And so so every customer and every every rep is reaching out to my team saying okay what do we do now and our team is not I mean our team has not been enabled we don't know anything.

00:02:58

Casey LaRose: about it. Um, we're we're learning, we're reading the FAQ right along with everybody else and I am very unclear right now if the cyber 3 cyber flash is like is the go to market owners for uh cyber flash is that is that a the AI specialist team is that the core team?

David Stone: It's it's the core team.

Casey LaRose: It's not our team.

David Stone: It's Megan Bruce and team um is the core people pushing this out. And that was only found out last night as I was digging into this thing for a Bank of America presentation this morning um with their key people of how do I get into 3.8. It's like really

Casey LaRose: So Megan is part

David Stone: Mega Bruce. Yeah,

Casey LaRose: Okay.

David Stone: she's the product owner under DeepMind and some of the um 3.8 flash and the cyber models uh that's been integrating it into code mender. Um and then the rollout strategy is also not clear on a sales role roll into production market with a

customer. The different tiers of customers that get sometimes direct access to the model or then have to access it through code mener.

00:04:11

David Stone: Um but to get direct access you need to be on a tier one list. So it's not a clean path and only those tier one ones have to be approved by government or defended by to by Google to the US government and others while they get direct model access like this is not a clear conversation on go to market of how do we roll this product um but yeah we learned that the same time you did with no real enablement before it. So I think that's one of our big challenges we need executive support on is give us your product roadmap. Tell us everything coming in the next month to three if we're lucky. That's Google three I I take 30

Casey LaRose: Maybe 30 days would even I mean just to have a month um would be would be great,

David Stone: days. Yep. 30 days I take because at least we can craft the strategy and the narrative before the products hit and

Casey LaRose: you know.

David Stone: say here's the big direction and then as the products come in you say look here's the plug-andplay to what we were talking about five seconds ago.

00:05:04

David Stone: Here's the plug-andplay. Like, because otherwise we're just like, yeah, we're shooting in the dark a little bit.

Lindsey Wood: Yeah, I was just going to say Casey um Megan is we're very well acquainted with Megan from the code bender AI threat defense work that we've been doing and she's been a pretty good partner to us in the past. So, I think I'm confident that that this can continue and I know Christia and Brian who were invited to this call

have worked with them very closely and so I think I would probably leverage their engagement with Megan um on that. But to to your point, if we could get visibility to the next 30 days, we just need a shift. So we're out of a reactive mode and into some sort of proactive offensive mode where like 30 to 60 days would be great. And we need an operating model for when they have new releases that they're just they're informing us to the extent they can with as much advanced notice as possible cuz otherwise it's just empirical. Every time.

David Stone: Yeah, let's see if we can get Ary.

00:06:01

David Stone: He was on the phone call with me for um was it TD or something here shortly? So like let's let's see if we can't get him to help us with the product roadmap along with Sandra. Um that'd be great. Just a regular reoccurring and if not them, who on their team like who owns that piece?

Casey LaRose: Yeah.

David Stone: I'm sure that

Casey LaRose: And and yeah, and that and that's what I I asked, you know, because I immediately went to Chris and I said, "Chris, hi." You know, because he was on the on the email. I said, "You know, we haven't had a chance to work together yet, but this is basically what I'm being asked to put together. And this is really like I mean as you can see what people are doing right now is they're creating these massive AI generated documents for

Alicja Cade: Mhm.

Casey LaRose: strategy which may or may not be the correct strategy right I'm all for using AI to to make our workload um you know more manageable but we in the field should not necessarily probably be crafting the strategic narrative, right?

00:07:07

Casey LaRose: We're we're the we are the the delivery arm. We're not the this the ideation and defining our own our own go to market product strategy. So, um but I know that the the ask that Rohit, he actually had three asks, two of which I have sort of already tackled. And Lindsay, I I'd love to get a little bit of extra time with you just to just to show you what I created for Rohit. Um because he wants to know like what's the health of the overall business for security, but obviously I I only own like a third of all of the security things that we can offer to customers. Um so I can show my my my view of the world. Um, but he wants a a simple brief that we can go talk to our customers about that is in response to the anthropic announcement that was just made. Um, and the anthropic announcement is about, oh gosh, it's about like uh secure guard rails that they have they have a I'm not sure if you've had a chance to read it yet, but um

00:08:24

David Stone: Yeah. Uh I did um I think that was the zero uh data residency basically was their big announcement is they finally caught up to zero data residency on anthropic but then they listed out hey we worked with the arc as a contributing blah blah blah. My guess is that's just marketing FUD. They asked some of the ARC sysos and then leveraged the ARC name underneath it. Um but I'll I'll ping with them. But to your point, we need to be putting out the narrative around what we're doing. Like the heck with all that that's FUD. I got it. Um, but like they're catching up to some of guardrails we intrinsically already have.

Nick Godfrey: Okay.

David Stone: So, we've lost some advantage on some of it, but we still have more than they do, I think, um, on this.

Casey LaRose: Yeah. Yeah.

David Stone: Yeah.

Casey LaRose: So this the this is the announcement that I think prompted Roit's message is the combination

Alicja Cade: Mhm.

Casey LaRose: of the EFS and the CDR.

00:09:16

Casey LaRose: So again, I mean, I will absolutely 100% just defer to this wonderful group because this is really not um part of the of the um charter that our team has. Hi Meg. Here she is. She is a machine. The one, the only Meg Tucker. Um, thank you Meg for putting together this really awesome document um that you shared. Uh, we were just reviewing it a little bit and then we were trying to figure out what our next next steps were internally to get Rohit the thing that he's asking for. Um, well, you know, I think, you know, sometimes when you need a lot of information first before you can call it down. So,

David Stone: Okay,

Casey LaRose: thank you for for giving us a framework for your insurance business.

David Stone: cool.

Casey LaRose: Um, Rohit wants a simple, succinct security briefing outline or agenda that we can go present to top customers starting next week. Um, so I I do think I do kind of think about it in three pieces. A one-pager white paper.

00:10:35

Casey LaRose: Okay, a white paper. Um maybe we think about it in terms of like here's what we're doing Google corewise. Lindsay, I think I shared it with you. Core and then um Gemini Enterprise security layer and then the mandant with sort of secops GTI layer. There's there's those three pieces. Um maybe

Nick Godfrey: Who who gets who's who is supposed to be selling code mangler just as an example Casey and who gets comped on it?

Casey LaRose: The AI specialist team sells code. Yeah. So that's Yeah.

Nick Godfrey: The road the road the road considers that part of sec the security revenue.

Casey LaRose: So we well here this is the challenge Nick right. We have the whiz team going and selling the whiz solutions and they are not necessarily being enabled yet

Alicja Cade: Mhm.

Casey LaRose: to tell a broader Google story and their leadership is not is not also expecting that of them. Then we have codemen and maybe this is 3.8 Gemini flash is going to be sold by the AI specialist team.

00:11:56

Casey LaRose: I don't know. or its core rep and then we're kind of the people over here saying well let us help you protect it you know protect your enterprise so if you want to secure Gemini agent platform we have tools and we have capabilities to do that if you want to secure Google cloud here's all the guardrails here's all of our you know here's where we thoughtfully put our security controls so there's kind of like the security of of Google there's security of our models and agents and then there's here's how we help you secure your cloud and the rest of your enterprise. That's was mandate secops, right? So, we're we're we're not necessarily in that in the nexus of the thing that's that prompted Roit's outreach. Flash and anthropic were the two things that that prompted his outreach.

Alicja Cade: But in a way, isn't that one of the root causes of the fact that we are in a catchup mode?

Margarette Tucker: Yeah. I mean,

Casey LaRose: Yeah, Meg, you can you can Why don't you comment because you can you have this view from the outside in, right?

00:13:10

Marguarette Tucker: well, so Lindsay, go first. her hand was up and I don't want to and then I'll I'll give you um from where I sit uh what I think he's asking for what he wants to come out of that and then like there's clearly internal work that we'll need to do but like this isn't new stitching like multiple groups that don't talk to each other together ahead of the product being ready to do that. So like that's kind of all we do in my role. So um you know that's what eight eight components.

Lindsey Wood: Funny enough, my my comment was around Yeah,

Marguarette Tucker: Yeah. Um

Lindsey Wood: my my comment was around something very similar that Casey said earlier like because of how we're positioned and what we're seeing in financial services and you know industry trends and and and everything

Marguarette Tucker: yeah.

Lindsey Wood: that's going on we often do have to create the prototype of what the go to market looks like because

Alicja Cade: Mhm.

Lindsey Wood: as Meg mentioned we sell everything in in Roits Oregon so we are the glue and that's what we're

00:14:03

Marguarette Tucker: Yeah.

Lindsey Wood: doing here is trying to figure out what is the right way to stitch this together because we might be ahead of the curve compared to some of our peers

Marguarette Tucker: So, so I'll run with that for a second. So, so David and I actually just had a long conversation about this earlier this week a bit and so like this is already top of mind for me. Like take me as the most simple point of view. Like assume that one I my team literally gets paid on everything that we sell. And so it doesn't matter.

There are so many buckets in our comp plan. It's silly. What we care about right now and at least in insurance and at all of the accounts that Roit cares about where

Alicja Cade: Mhm.

Margarette Tucker: Anthropic is super tight and they have this sort of prototype that they're rolling out that matter to him outside of insurance. is that we have the board and the seauite. And so everything we do, we need to be bringing like an assumed security layer to everything like now everyone's not great at that but this group my team Casey and I we don't play so what and every 100% of my business that I'm selling right now is AI like do I have data tied to it sure but like this is not infrastructure or compute we're building a fully like AI business in in insurance like we're the third cloud app best if at all in any other scenario and I hardly have any data

00:15:28

Margarette Tucker: gravity. What he wants is he's under a significant pressure in those particular accounts because of the relationship with Thomas and Ruth and Jane Street and Citadel and CME and where we are with all of those relationships in Anthropic. We have tenfold more than any other industry concentration does like in our businesses and same for me. And so what he's trying to get ahead of is and I can share how I've written this more broadly and we need an insurance tab for this is just like how do we tell the story across like where we are coming and how they should be thinking about it and how the news about the models coming out and the commercial story coming behind FSB and trying to come off like we're easier to consume is the right way to approach it. Now, behind the scenes, we'll have to figure out like depending on each of those accounts and what he wants is a list. And Casey, I will help you with the dashboarding part. Don't worry about that.

Casey LaRose: I already built the dashboard.

00:16:28

Marguarette Tucker: But he's look at

Casey LaRose: Well, you I did. I'll sh I'll share it with you. Um I'll share No.

Marguarette Tucker: achiever.

Casey LaRose: Well, I mean, listen, I don't know if he's going to like it, right? So, Lindsay, I'll plus you into it as well.

Marguarette Tucker: That's well, I'll take care of that part. So, so,

Lindsey Wood: Yeah, don't worry.

Marguarette Tucker: so yeah.

Lindsey Wood: We We got you.

Marguarette Tucker: Um I I think it's more like listen in a perfect world if someone had to stand before Thomas and he checked our math on what we present to a room and we had a pretty clean canvas they were like what should we be deploying like we should have a point of view on that in all of our accounts and financial services if we're launching 3.8 and essentially telling everyone that it does everything that mythos does etc. like we need to define what that means and why that matters like and so in my paper and like I hate doing sloppy work and like that was me hurrying up and sending it over like how I would want to frame it is internally we need to educate our sellers on why this is top of mind and in particular in finance like what did Enthropic announce and why does that matter and what are our customers going to be asking about and then what is the framing right and then we take the framing that does not have to be product specific then in an account

00:17:40

Marguarette Tucker: level we need to be ready to be proactive about it being product specific and we should walk that back from the order in which he gives a s*** about plus the things we care about. Right? So like that's got to be a list of said number. Lindsay can manage that. Then we can determine what we want to capture in order to track complexity. ities which is like they're an SEC they're an agentic sock customer and there's the whiz thing and then there's like you know do we want to position code over a certain whiz product like what hard questions do we need to ask ourselves in order to ensure we're putting something we can scale in front of them that to me is like

number zero which is plenty my document was more I think in the world of why buy anything, why buy now, why buy Google, why is this a topic? Because the following things are happening in the market and in financial services in particular, like it's non-negotiable. These are things everybody has to think about.

00:18:39

Marguarette Tucker: Okay, great. What's the competition doing? And then how are we like what do we want? The commercial stuff is sort of like an afterthought. Like go do your job, tell it to the right person, ensure we're being proactive. let's get a message in front of them that they can then like check a box that they did and then we can determine sort of what the next step is. I think someone in parallel to that should be thinking about like okay 10 people are going to be like I'd like to have a call and have an inside conversation on this and what is that conversation that's then like okay here's the agenda I think it's like what's shaping the industry it's like them coming in it's a one-hour EBC session and then like that's where I tap David and be like okay you tell me now the answer to that question like I know we don't know exactly, but I might sound like an oversimplified salesperson, but I think what he's trying to get at is how do I equip these execs and my sellers and my team to answer some of these questions,

00:19:42

Casey LaRose: of course. Yeah. No,

Marguarette Tucker: commercial products that are coming the market,

Casey LaRose: I mean I get it.

Marguarette Tucker: and then like listen, Aaron's team needs to help. So, like I just tried to put some framing together. Raph is a roll up his sleeves kind of guy and would definitely help and partner with you and you would probably explicitly said that his team is going to be hyperfocused on selling code render. I would suspect we probably

should train some people if we're going to do that and we'll we'll we'll we'll need to decide as leaders in an industry specific vertical what that messaging needs to look like which takes me back to number zero. I don't know it's messy. That's kind of what I like am unpacking from what I woke up to this morning, which was his email that you all got to see to like, hey, I got a bunch of commercial cycles, too, that are going in September. like can we get our s*** together so I know what I need to include and then get that in front of the CEO so I can get them to say yes like while we build the plane like if this is in and we're having this part of these like FSB conversations like someone tell me so I can add that to the list of things I should be getting approvals on paperwork around and any additional language like added.

00:20:58

Marguarette Tucker: to the contracts because AON and farmers are not small and I know we're down a path on the AON side or these can be like pullthroughs but

Lindsey Wood: at that point. We we need Aeron's team to lean in on FSP and how that relates to this as well because that's all still a bit of

Marguarette Tucker: I can do that.

Lindsey Wood: a black box. I know. I know they're working on and some of it's coming out today, but

Marguarette Tucker: I think that we need to walk back the the largest targets for Rohit commercially from a security perspective and where he's most concerned with these anthropic use cases and also be ensure we're very down a path of like where is anthropic being used because we want all that running on Google if we can't go get it first party and then how do we want to do the competitive positioning who's got the ball and who delivers the message should be the least of our concerns we just need to hack at my paper. Like take make a copy, take things out.

00:21:58

Margarette Tucker: It is like there's an internal executive tab that says like these are the reasons you need to care about this and this the questions your customers are going to be asking you. And then there's a like what's the exercise between Casey, you and David, and then Aaron and his team around like what's the expectation on what you guys are like trying to push here and what considerations do you need to hash out?

Casey LaRose: I I I feel like I feel like the way that we're doing this is still shipping org charts every single day instead of saying like I I really really feel strongly about this and and probably Doug Burch is is like you know wrote me up with HR for for how many times I have like lost my Irish temper about this in front of him. Um, but I'm like, "No, no, we can't say Aaron seems hyper hyperfocused on codemen and then Whiz is going to

Margarette Tucker: What the f***?

Casey LaRose: just do the whiz part and then we're going to do a we're going to somehow try to wrap our head around where is anthropic making progress and then what's our answer to that, right?

00:23:06

Casey LaRose: We need to have a holistic security message that every single person at Google, it doesn't matter what their role is, says every single day. Like it's something that we memorize and we repeat and we internalize and understand. We need a package. We need to be able to give the customer optionality contractually. And I think like the the flexible token thing is is a good start, right? We're saying like, yeah, play with it. um you don't have to commit right if you think about why why are we struggling because we don't really have a security delivery executive in a role in this company right like if you think about how other companies staff their go to market there are these sort of like strategic or field t CT CTOs that have these roles and they are trained on the portfolio. What we have today is we have four deployed engineers who are focused on Gemini enterprise agent platform and codemen but they have no

knowledge of any of our intelligence or our threat defense offerings. You got whiz who will actively say I'm not going to talk about this.

00:24:18

Casey LaRose: I'm not going to engage there. they're they're like backing away and I understand that like they're very new to the company and they are not incentivized. So they're being told by their leadership stay in your lane. Um and then you got our team who has historically been bringing this unified message even if we didn't get paid on it because we were the only security team. We didn't used to have four deployed engineers last year. We didn't used to have code mender last year. like we didn't have any of these things and and the whole world has you know changed since like April 1st and Mythos you know happened. So I I just think people are so I mean the amount of like people are reading me the riot act about how we are not engaging the right way and how we don't have enough pipeline. Um, and I'm like, well, it's been it's been a pretty rough four months because our entire, you know, product leadership and and executive team walked out the door. Um, but we're here now.

00:25:22

Casey LaRose: So, what can we do? I really think that we should just have a an overarching like this is the unified security story and this is how we secure X, Y, and Z. Like I think groups of three are things that all the executives understand and I know Rohit and TK are very partial to that approach too. But we we have to have the top level. We we can't we can't do it from the bottom up with AI teams doing this and security teams doing that and core team doing this. It just doesn't it just it has never worked. Um I'm very happy to like put on paper what I think that top level story is. I think we just need to have a we need to have a contract vehicle that says buy off

Margarette Tucker: We we we listen.

Casey LaRose: this

Margarette Tucker: So those are so four 3x3. Yes. So first things first, it's messaging, right? Like to your point, what is the value prop? That's got to be a 3x3.

00:26:17

Margarette Tucker: What are like if if Rohit calls David tomorrow or Alicja tomorrow and says come into JP Morgan and have a conversation with the most senior people anthropic got to them on these topics they want to hear what our point of view is like what is that that is thing one that's a 3x3 and that's that supporting messaging and those are the core things that we need to get together and when he says be proactive that's what he means he doesn't care who owns it doesn't necessarily matter what components that comes together if we put something

Casey LaRose: Yeah.

Margarette Tucker: best-in-class ask in a toptotop sponsored account where there's Ruth or there's Thomas, how are we positioning ourselves based on most recent announcements both with our competitors and at our own company? That's Then I think two is the comp plan and like go to market which means like what teams activate and what sells what. And I don't think we need to worry about that. Here's why I'll tell you in any of these accounts this is going to be top of mind and I can assure you in my business we don't we you know this we don't run independent cycles to a point where we don't look at it cohesively and if we're going to do this fast and effectively we're going to meet with the executive sponsors which means that that's everybody's customer.

00:27:28

Margarette Tucker: So there'll be alignment on all of that and I don't think you have to worry about that. That to me becomes a problem when we look at like Michael Clark and the geos and how we do this horizontally. And I just I don't know for better or worse micromanage my business enough where like we won't see an impact on that

with insurance in particular. And I row hits kind of the same way. Uh which is why he and I sort of work well with Thomas. Seems like that. Um so then there's there's that right. So, I think like fair good call out, we can manage through it. Um, and then it's just like what's how do we get what's best in class out fast. Commercially, the FSP is evolving literally every day. Like each day I wake up, somebody's having a new conversation about like should GECX be there and should this be there. So, like we're running with scissors with that. I think we should all assume that there's the now deals that's like right now September and we're all in the uncomfortable land of like contracting stuff before we know anything and then everybody's going to wait and there'll be another round of those in November when we like know what we're doing and the plumbing is in place.

00:28:31

Marguarette Tucker: And I think a big part of that is just how are we dealing with like anthropic and FSP because that sort of is part of that conversation there, right? And so I think we just have to assume that's going to come. That's a good problem to have if we're at a point where we need to be discussing that. And I think Lindsay and Roit and the commercial team can put together the list of where we have like near-term compelling things and then the rest of that evolves. And so I think the beautiful part will get there.

Lindsey Wood: I think it's the same list that we've been Yeah. And I to be fair, I think it's the same, you know, top 10 list that we've been chasing. It's the city, Wells, Morgan, Goldman. I'm sure Citadel will end up in some of the cap market still on them there. Your top accounts, Meg, you mentioned AON, New York Life, I assume.

Casey LaRose: Hey AG.

Lindsey Wood: Um,

Casey LaRose: Okay.

Lindsey Wood: AIG. Exactly.

00:29:22

Lindsey Wood: I think that's where like the level we need to be at is the top marquee insurance accounts and then those top six capital markets and banks that we've been engaged and competing with anthropic all year.

Casey LaRose: Well, yeah.

Lindsey Wood: Like those are safe bets and then we can add the fringe at the end.

Casey LaRose: You you you know Yeah.

Lindsey Wood: Yep.

Casey LaRose: You you know where you're competing against anthropic.

Marguarette Tucker: Everywhere.

Casey LaRose: And I I guess I just I have to rely on on OISO, Brian, and Chris Diya to basically put together the the the security narrative around that, right? Like I But yeah, I mean and I I do think like if you just think about it at the simplest level, how does how do our our large competitors position there? How do they contract? It's always like flexibility, optionality, like you can use buy buy a million tokens and use them for anything. Palo Alto uses a credit model. Sentinel or Microsoft uses it, you know, an ELA model and it's all you can eat and it's, you know, it's \$30 million and you get to choose your player.

00:30:31

Nick Godfrey: Okay.

Casey LaRose: Um, we've never had that kind of pricing model. I'm pushing, I've been asking for it all year from Jeff Parry and it's actually in my deck to Rohit is that we need the flexibility,

Marguarette Tucker: Casey,

Casey LaRose: the optionality

Marguarette Tucker: there's a training right now that's kicking off that's FSP training that you guys are going to that like this will likely, it feels like, fall under this construct. I recommend Let's hop over there. I've heard this 700 times, but I want to be on because I know the questions that are going to come out of it. Um, if you guys need to stay on here, I'm going to hop over there because I told Aaron I would support him on that call and there's a New York Life uh co-innovation call I need to hop on.

Casey LaRose: Okay.

Marguarette Tucker: Um,

Lindsey Wood: I did.

Marguarette Tucker: I Yep.

Lindsey Wood: Yeah. Go ahead. Oh, no.

Marguarette Tucker: No,

Lindsey Wood: I was going to say

Marguarette Tucker: I was just going to say I'll help in any way I can.

00:31:20

Casey LaRose: No,

Marguarette Tucker: It's hard to off.

Casey LaRose: me, we appreciate you being the being the uh the translator because you know I I want I want to solve this. I want to solve it.

Marguarette Tucker: Lindsay has to solve it because she has to create the dashboard forum with you guys. So like, well, it's your problem,

Lindsey Wood: You just need to if you put it in a doc or a spreadsheet,

Marguarette Tucker: but it's it's not it's not really

Lindsey Wood: I can use jet ski. We we got this. No problem. Um and then I have a meeting with Chris Diya later today and we're talking about FY27. So if there's a message, Casey, just ping me what you need from him and I will ask him live this afternoon, but I also need to hop to the FSP call.

Casey LaRose: Okay. Okay. Great.

Marguarette Tucker: Casey,

David Stone: Thank you.

Casey LaRose: Um

Marguarette Tucker: we'll make it okay.

Lindsey Wood: Thanks. Y

Marguarette Tucker: And like we're already being very careful with David's time.

00:32:06

Marguarette Tucker: And if there's anything I can do to be useful, let me know. But like we have \$14 million in business we have to write between now and the end of the year. So like we will do it.

Casey LaRose: Oh, and we we we've got it. We we got it.

Marguarette Tucker: I know we do. All right. Thank you so much for everything. It's good to see everyone. It's always fun.

David Stone: Thanks.

Lindsey Wood: Thanks everyone.

Casey LaRose: Okay. Um, so was did we get any did we get the right level of clarity from that conversation? Um, do we just need to start writing our 3x3 or do we already have a 3x3 that we can just update?

David Stone: based off the announcement like If I read through that, like yes, we we we probably have enough in the announcement that we could go through and say the 3x3 and how we respond to that. I think there's a bigger problem around how do we message this so we don't have to get into the fire drill every 5 seconds of anthropic releases some article or somebody else does, don't care who, and they claim they have functionality.

00:33:24

David Stone: Great. it got to our we we can show this strategy holds. We're still ahead of them in all these areas and it holds for a month or two maybe all ask for in this

Casey LaRose: right?

David Stone: world. Um, so like that would be and then the key area then goes back to we really do need to know where the product teams are headed when they're releasing stuff out the door and we can then hamper some of their messaging on okay anthropic just released X we've got Y in the pipeline for tomorrow like just wait a second and here it is it's better like this is yeah this is pretty good point it's predictable

Nick Godfrey: Yeah,

David Stone: Yeah.

Nick Godfrey: it's it's disappointing that the the relevant AI teams weren't ready for this.

Alicja Cade: Yeah.

Nick Godfrey: You know, this is a marketing game and we we have failed again.

David Stone: Yep. So,

Casey LaRose: Yeah.

David Stone: do we want to then circle back with Chris yourself, Casey, and do the 3x3? Is that is that where I heard on that piece?

00:34:24

David Stone: And then I'd love to bring in a product team person, and I want to put them on a freaking monthly cadence or a two-week cadence. what is coming out in the next two weeks, three weeks, four weeks, etc. Hey Chris, welcome to the party.

Nick Godfrey: Okay.

David Stone: Um,

Alicja Cade: Okay.

Chris Diya: I just saw this. I was on a capacity escalation and I saw this on my calendar. So, apologies for being late.

David Stone: no, we don't need capacity. Come on. We've got you to hold both ends of the wire,

Chris Diya: Not a problem.

David Stone: right? Um, uh, so we do need that piece of it. We do need product team and these um Megan and team to help us out on like release schedules. So like we need all that. Um yeah, but we can start with the 3x3 on the just immediate announcements and like how to res how to talk about that. But that's a marketing like Nick was saying that marketing we need to prepare for these um when we release something we know they're going to come back with it.

00:35:25

David Stone: We need We need to have a pre-planned 3x3. That's the best way.

Casey LaRose: Um well in the 3x3 to me this is where we have to say that there are there are three teams that are a component of our security offering right or maybe more maybe more like four or So,

David Stone: Yep.

Casey LaRose: so if what we're trying to do is create the new top level message that every single person at Google Cloud will know and repeat as a way to introduce our security story. The top level message, I mean, I I have created one, but I don't know that the rest of the company agrees with our top level message, the one that I wrote. So, I'm happy to share that and get everyone collaborating on what the top level message is. Um, and let's all agree that we have a one minute and a, you know, 30 second and a three minute way of explaining our our security offerings in their entirety and ways that we ways that we engage with the customer. Why why we have a compelling value proposition and then we go into the one, two, three, right?

00:36:45

Casey LaRose: And the first one is I believe the core. The second one is models and agents. And the third is securing your cloud and enterprise. That's how I think of it. But I obviously welcome everyone else's thoughts. And um if you don't think of it in those categories, if we think want to think about it in other ways like code, users, network like I I think I think breaking it down in a traditional sort of security layer,

Chris Diya: Thank you.

Casey LaRose: security control is probably not because we have so many

David Stone: What?

Casey LaRose: intersections of our offerings that crisscross. Um like if you were to say oh all the ways that we secure a network is that's across all of our offerings right so I know this is a problem that we've struggled with our entire and then when I joined in 2018 we didn't have a security business unit um you know we've never been able to get this story like sort of nailed down to the point that everyone agreed on what it Yes.

00:37:50

Chris Diya: I would say in past years we had product leadership that had a strong opinion on what the security story is or was at the time. I'm curious what does product leadership talk about when they talk about our security story today?

Casey LaRose: Well, when you say product leadership, Chris, which product leader, what product group are you talking about?

Chris Diya: The fact that you're asking me that is the first problem. Like I and obviously we can't solve that problem but like if in in in previous

Casey LaRose: That's right.

Chris Diya: days Sunnil was like the clear product security product lead right he didn't own everything but he he owned most of it and he set a very clear vision of like this is this is how you do threat detection. This is how you do data protection. I did all these things in in with Google. Um whether it's SEO ops, whether it's Apogee, it doesn't

matter what it is. Like there was a clear product direction. And I guess I think we can form our own product direction.

00:38:51

Chris Diya: Um for sure. Uh but it encompasses like five different sales teams. It encompasses a lot of different points of views. is B. bas on incentives and things like that. And I would love to be aligned with what our product leadership thinks the product direction is, which is why I'm asking that question.

Casey LaRose: Yeah. And I don't think we they haven't really told us yet.

Chris Diya: Okay.

Casey LaRose: And I mean the other thing is Sunil used to own he used to own cloud security and product security.

Chris Diya: Right.

Casey LaRose: So that's why it was easy for him to have a unified v vision. And when he left that product responsibility that his responsibilities actually got broken up into three parts. Um,

Chris Diya: Yeah.

Casey LaRose: and so that that fragmented the message. Obviously, we've had some significant changes and I think just about last week, the new VP of product for Gusto offerings was announced. I actually don't know who's head of core cloud security products at this point.

Nick Godfrey: Ultimately,

00:39:49

Casey LaRose: Don't know who that product leader is. Is it Brad Calder?

Nick Godfrey: yeah, it's Michael Bman who reports to Brad.

Casey LaRose: Okay.

Nick Godfrey: Yeah, I I do think I do think gently without expectation of fixing. We do need to make sure that Roit's aware of very big or shipping problems like as I said as I said in chat there are fundamentally two teams who are trying to sell code member that that doesn't make any sense right that's really dangerous it makes us look inconsistent the customer makes it look like we haven't got a strategy and so big things like that they do need to get resolved I think you can use it via Gemini enterprise or you can use it via whiz

Chris Diya: Yeah.

Casey LaRose: But who are The two teams trying to solve

Chris Diya: Yeah.

Alicja Cade: Mhm.

Chris Diya: You've got AI sales specialists selling Codemener through Model Garden. You've got Whiz trying to sell Code Mender. Um, and then you've got about four to five other harnesses that are getting talked about as much if not more than Code Mender that just make the story more complex for our customers.

00:40:51

Nick Godfrey: I think part of the challenge there with anthropic is they're a much smaller company and so their messaging is a lot

Brian Schmult: And then you've got

Nick Godfrey: cleaner.

Chris Diya: Yeah, their their answer is go by cloud security that like it's a very simple answer.

Alicja Cade: No.

Nick Godfrey: Yeah.

Casey LaRose: But what if what if so this is what I'm saying this is why I believe very strongly we have to stop shipping our org chart in the way that we explain

Alicja Cade: Uhhuh.

Casey LaRose: the security offering. We need to explain the security offering as Google as Google's unified security platform or whatever you want to call it. I don't care what you call it. But it includes code mener. It includes whiz. It includes secops, right? It's it's our unified portfolio. Obviously, we haven't done uh we haven't done really any work to name it, but this is this is what my team has been using. This is what my team does because in the absence of any kind of other direction, we had to come up with our own unified messaging where we start at the top and then we we talk about you know we we have oversimplified it greatly, right?

00:41:56

Casey LaRose: We have said that Every every security organization post mythos has to have a plan of attack that they execute. How do I address this post miso postmethos threat landscape? So we talk about the plan of attack boots on the ground in executing against those key objectives. That's where we say Mandy comes in right we are helping you and obviously every chief security officer the minute that meet those happened they created a strategy. So at this point when we engage with CISOs we say how are you executing against your original strategy? Do you want do you need to tweak it? Are you feeling good about it? Where are you behind? Right? So we don't assume that they don't have one. We assume that they do because they have been working on it for months and months and every gsi in the world is like whispering in their ear. So we say where can we either help you tweak it, strengthen it, can we give you boots on the ground? Right?

00:42:54

Casey LaRose: We we it's very generic but there's right that's sort of like how do we execute both miso then we say now we have to address um the vulnerability side of the house right we have to remediate vulnerabilities we have to fix the code we have to prevent new vulnerabilities from being introduced into code that's how within code

mener function right so it's let's make sure and and get every single vulnerability remediate that we can. However, we know that across application systems, databases, network, cloud, it's probably not going to be possible to get to zero vulnerabilities. There's a window of time, which is your window of exposure. Your window of exposure, we don't really know how long the window exposure will be. It may be that AI advances enough where we get to a place where there are zero vulnerabilities, but we're not there right now. So, in the meantime, you do need to be able to defend yourself at machine speed. And that's where our agentic defense capabilities comes in with whiz defends, right? We enrich it all with with Google's global threat intelligence.

00:44:08

Casey LaRose: So, it's it's plan of attack, protect and prevent everything that you can, and then to address your window of of exposure. Um, be ready to defend yourself at machine speed. So, it's it's, you know, it's protect, prevent, detect, respond. It's it's kind of like a little mini NIST. Um, and that's the messaging that we've been using. And it's we don't talk about products like we just talk about it in the broadstrokes of being able to do agentic defense and being attacked at machine speed. And there's like a hundred categories underneath that. But I don't I don't know if that message resonates with anybody else. That's the that's the way that we've sort of silly stringed it together so far. Bubble gum and scream.

Alicja Cade: I I think Casey there's another part to it that we have to think our customers have always said how easy is it to to plug in to implement right so there has to be after what we have I I actually think okay the kind of the narrative will be overall kind of Google philosophy then what challenges we are seeing hearing from the CISOs and then what products services help to could help you resolve those challenges rather than and

00:45:27

Brian Schmolt: Oops.

Alicja Cade: and only then talk about the perhaps the stack etc and how how that helps but then also what do you need to do to actually make it work because this is what the Caesars are struggling with you know any panel when we're talking about the uh agentic thread defense and all that people are saying well where the hell do I start what do

Casey LaRose: Well,

Alicja Cade: I

Casey LaRose: I mean, and the thing is I don't want to Yes, I agree. That's where the hell do I start? Like that's where our forward deployed engineers say you start here. Your plan is A, B, and C, right? That's the simplicity of the forward deployed engineer model. And obviously it's only done through great discovery. The reality is it's not easy to plug in all of our stuff and some of our stuff is still getting getting baked. Um but I don't want to I don't want to take away from the goal right now which is we have to come up with some messaging so that we can do briefings.

00:46:31

Casey LaRose: I guess this is AI threat defense 2.0 um where we have a list of customers that we want to go brief about what our capabilities are and then we have a plan of attack that the the FTE team feels confident in which obviously better better minds than I will define and and execute that. But like

Brian Schmolt: it. I joined late to this conversation uh after having lived through AITD like the rest of you did. Uh we have to have the whiz story sound before we go do this.

Nick Godfrey: Yep.

Brian Schmolt: If we start a whole presentation series again without the answer to like where does Whiz fit in all of this,

Alicja Cade: Mhm.

Brian Schmolt: going to do probably more harm than good.

Alicja Cade: Absolutely.

Chris Diya: and the the agent story too. Like what we're seeing over and over again is, you know, we walk into uh into firms, Robin Hood's a great example, 40 plus agents running within their sock and we've only got two to offer today. So, like what's our like I I know we're growing and building that product, but in the meantime, what's our story and how does that fit into the narrative?

00:47:35

Chris Diya: So,

Brian Schmult: So what's next? What are the next steps here?

David Stone: Yeah. So, sounds like whiz is a mustave on product that we need in this conversation. Who else is

Casey LaRose: But but how how is that? How is with not included in the prevention and protection category. That is what WIS does.

David Stone: Uhhuh. No. Great.

Brian Schmult: Yeah,

David Stone: I I think we

Brian Schmult: that's what that's what we're saying is when my my point was when we started this whole AITD thing, we didn't have a very good talk track between where and how whiz fits in both between SEC, both between codemen and whiz code. Like it caused a lot of confusion. So I'd very much like to have that hammered out like 100% before we talk to anyone.

Casey LaRose: But why can't we just say our our objective is to secure your cloud wherever wherever you run cloud workloads? Why can't you just say that instead of talking about Whiz versus SEC? Because SEC is a non-issue, by the way.

00:48:43

Brian Schmult: Well,

Casey LaRose: I don't think anyone's selling

Brian Schmult: because the the the follow on the follow on question is always Google,

Chris Diya: Well, because it

Brian Schmult: you have four separate ways of doing this. Like I hear you, but what's the difference between all of these and how do we use it?

Nick Godfrey: Yeah, that that that's the problem.

Casey LaRose: Well, I mean,

Nick Godfrey: It makes us

Casey LaRose: I guess I guess assume that SEC is no longer a problem, right? It's no longer a problem.

Chris Diya: But I think the goal shouldn't be how to secure your cloud. It should be how to secure your enterprise and how to secure your data.

Alicja Cade: Uh-huh.

Chris Diya: And so then that brings

Casey LaRose: That's right. That's a good point, Chris. And Whiz is a cloud security platform, so it secures the cloud. That's actually my whole point of prevention and protection,

Chris Diya: right right

Casey LaRose: right? How do you secure the rest of your enterprise? You can't do that with just with you have to bring more offerings into the

00:49:28

Chris Diya: and it's right but I wouldn't even consider the rest of the enterprise

Casey LaRose: equation.

Chris Diya: what is the holistic pitch to the entire enterprise right doesn't matter if it's cloud doesn't matter if it's onrem like at the end of the day all the telemetry All of the intelligence is going into one place or two places, doesn't really matter, but some agent

is manifesting some sort of finding and either acting on it or presenting it to a human to act on it, right? From a threat detection perspective.

Casey LaRose: Yeah. I mean, again,

Chris Diya: So,

Casey LaRose: I guess I don't to me I don't see any conflict with that. Like we talk about detection and response enterprisewide. We have a a ca a set of capabilities that delivers that for you.

Chris Diya: yeah, I think and agreed. I think like what I would want to be able to say is we protect your enterprise. we recommend leveraging this cohesive platform and here's a really easy way to plug agents in that either are listed as a a product, right?

00:50:27

Chris Diya: Like productized and and sanctioned by Google, uh created by FTEES or created by the customer themselves. Like here is how you're going to do that. Like to me that's regardless of product kind of where we need to get to.

Casey LaRose: Okay. So, do you then can you can we anchor on this? We need a plan, we need to prevent, we need to protect, we need to detect, and we need to respond. Like it's basically a NIST approach.

David Stone: I think it's a good place to start anchor on that and say overall use case and then plug into those four categories

Chris Diya: Yeah.

David Stone: below. Yep.

Chris Diya: Yeah.

Casey LaRose: But the way that you the the difference is that it's not linear.

David Stone: What? No.

Casey LaRose: It's not you have to do one before you do the other. You don't have to get into a eye formation and wait in line because you know the thing is Rohit is very unhappy with the his security number.

David Stone: Yep.

Casey LaRose: He's very unhappy with his security number.

00:51:24

Casey LaRose: What? How does Rohit achieve his security number?

Chris Diya: I think that's very different than building a strategic security vision.

David Stone: Let's clarify with Rohit his ask on the one pager because I think that will shape the one pager

Chris Diya: Yeah.

David Stone: we send back to Rohit that he can talk to. But to your point, he is very concerned about the security number. So if he's solving for that problem, okay, that's one conversation. If he's solving for the strategy, that's another conversation. Those two do interact.

Casey LaRose: Is it is it or can the two be integrated?

Chris Diya: Yes.

David Stone: It can be integrated. They intersect. But like if we go and talk about code mender for half a second,

Alicja Cade: I'm hurt.

David Stone: that's not going to solve his security number.

Casey LaRose: That's right. It will solve his AI number though.

David Stone: Well, yeah. What again? What problem are we solving for?

Brian Schmult: That that that point though is it's an internal thing to solve.

00:52:16

David Stone: Yeah, let's start with the strategy. Let's drive drive it down and they will intersect, right? Like maybe that's a second order problem that we figure out. That's a second.

Casey LaRose: Okay. A one a one pager and a white paper are the two things that I have heard out of this

David Stone: Yep.

Casey LaRose: meeting.

David Stone: Yep. And what's the next steps on who who do we invite to that meeting? And then it he says by next week I get what he says. Uh can we accomplish that next week? Do we need to push back on timelines? Um and then secondly like how quickly can we pull that together?

Casey LaRose: I just think it's I think it's fascinating because like I think pretty much everybody on this call has probably written this same one pager at least 50 times at least if not a hundred times.

David Stone: Yes.

Casey LaRose: Do we have a one-pager Chris or Brian that you have used in the past that you like? like what is your what if what if we all just said what if we all had to come up with a one pager and we all wrote it down and then we combined them. We just used Gemini and took five different versions of it and said combine these three.

Chris Diya: That's fair.

Casey LaRose: Okay. So, you want to come up with it by tomorrow at like 12:00 noon east coast time and then throw it into Gemini. I mean, I'm going to be in the car tomorrow afternoon. Of course, this is happening during Labor Day weekend. That's awesome.

David Stone: It's awesome. Always.

Casey LaRose: All right, let's see what we can come up with.

Chris Diya: Cool.

Casey LaRose: Thanks, Gemini.

David Stone: All right. Appreciate it. We'll talk soon.

Chris Diya: Thanks all.

Alicja Cade: Bye.

Brian Schmult: Cheers.

Chris Diya: Bye.
